Alerts

Name	Risk Level	Number of Instances
SQL Injection	High	3
SQL Injection - Hypersonic SQL	High	1
Absence of Anti-CSRF Tokens	Medium	97
Content Security Policy (CSP) Header Not Set	Medium	44
Hidden File Found	Medium	4
Parameter Tampering	Medium	2
Vulnerable JS Library	Medium	7
Cookie No HttpOnly Flag	Low	4
Cookie without SameSite Attribute	Low	4
Private IP Disclosure	Low	2
<u>Timestamp Disclosure - Unix</u>	Low	1
<u>Charset Mismatch (Header Versus Meta Content-Type Charset)</u>	Informational	1
Information Disclosure - Sensitive Information in URL	Informational	1
Information Disclosure - Suspicious Comments	Informational	65
Loosely Scoped Cookie	Informational	5
Modern Web Application	Informational	21
<u>User Agent Fuzzer</u>	Informational	703
<u>User Controllable HTML Element Attribute</u> (<u>Potential XSS</u>)	Informational	6
<u>Username Hash Found</u>	Informational	1

Alert Detail

High	SQL Injection
Description	SQL injection may be possible
URL	http://localhost:8080/WebGoat/register.mvc
Method	POST
Attack	agree AND 1=1
Evidence	
URL	http://localhost:8080/WebGoat/register.mvc
Method	POST
Attack	agree OR 1=1
Evidence	
URL	http://localhost:8080/WebGoat/register.mvc
Method	POST
Attack	agree' AND '1'='1'
Evidence	
Instances	3
Solution	Do not trust client side input, even if there is client side validation in place. In general, type check all data on the server side. If the application uses JDBC, use PreparedStatement or CallableStatement, with parameters passed by '?' If the application uses ASP, use ADO Command Objects with strong type checking and parameterized queries. If database Stored Procedures can be used, use them. Do *not* concatenate strings into queries in the stored procedure, or use 'exec', 'exec immediate', or equivalent functionality! Do not create dynamic SQL queries using simple string concatenation. Escape all data received from the client. Apply an 'allow list' of allowed characters, or a 'deny list' of disallowed characters in user input. Apply the privilege of least privilege by using the least privileged database user possible. In particular, avoid using the 'sa' or 'db-owner' database users. This does not eliminate SQL injection, but minimizes its impact. Grant the minimum database access that is necessary for the application.

CWE Id	89
WASC Id	19
Plugin Id	40018
Medium	Absence of Anti-CSRF Tokens

Medium	Absence of Anti-CSRF Tokens
Description	No Anti-CSRF tokens were found in a HTML submission form. A cross-site request forgery is an attack that involves forcing a victim to send an HTTP request way. The nature of the attack is that CSRF exploits the trust that a web site has for a user. By concern, XSRF, one-click attack, session riding, confused deputy, and sea surf. CSRF attacks are effective in a number of situations, including: * The victim has an active session on the target site. * The victim is authenticated via HTTP auth on the target site. * The victim is on the same local network as the target site. CSRF has primarily been used to perform an action against a target site using the victim's privile vulnerable to XSS, because XSS can be used as a platform for CSRF, allowing the attack to operform.

Medium	Content Security Policy (CSP) Header Not Set
Description	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable objects such as Java applets, ActiveX, audio and video files.

Plugin Id	<u>10096</u>
Informational	Charset Mismatch (Header Versus Meta Content-Type Charset)
Description	This check identifies responses where the HTTP Content-Type header declares a charset different from the charset defined by the body of the HTML or XML. When there's a charset mismatch between the HTTP header and content body Web browsers can be forced into an undesirable content-sniffing mode to determine the content's correct character set. An attacker could manipulate content on the page to be interpreted in an encoding of their choice. For example, if an attacker can control content at the beginning of the page, they could inject script using UTF-7 encoded text and manipulate some browsers into interpreting that text.
URL	http://localhost:8080/WebGoat/start.mvc
Method	GET
Attack	
Attack Evidence	

1

Instances

Solution	Force UTF-8 for all text content in both the HTTP header and meta tags in HTML or encoding declarations in XML.
Reference	http://code.google.com/p/browsersec/wiki/Part2#Character_set_handling_and_detection
CWE Id	436
WASC Id	15
Plugin Id	90011

Informational	Information Disclosure - Sensitive Information in URL
Description	The request appeared to contain sensitive information leaked in the URL. This can violate PCI and most organizational compliance policies. You can configure the list of strings for this check to add or remove values specific to your environment.
URL	http://localhost:8080/WebGoat/JWT/votings/login?user=Guest
Method	GET
Attack	
Evidence	user
Instances	1
Solution	Do not pass sensitive information in URIs.
Reference	
CWE Id	200
WASC Id	13
Plugin Id	10024

Informational	Information Disclosure - Suspicious Comments
Description	The response appears to contain suspicious comments which may help an attacker. Note: Matches made within script blocks or files are against the entire content not only comments.

CWE Id	200
WASC Id	13

Plugin Id	10027
Informational	Loosely Scoped Cookie
Description	Cookies can be scoped by domain or path. This check is only concerned with domain scope. The domain scope applied to a cookie determines which domains can access it. For example, a cookie can be scoped strictly to a subdomain e.g. www.nottrusted.com, or loosely scoped to a parent domain e.g. nottrusted.com. In the latter case, any subdomain of nottrusted.com can access the cookie. Loosely scoped cookies are common in mega-applications like google.com and live.com. Cookies set from a subdomain like app.foo.bar are transmitted only to that domain by the browser. However, cookies scoped to a parent-level domain may be transmitted to the parent, or any subdomain of the parent.

Informational	User Controllable HTML Element Attribute (Potential XSS)
Description	This check looks at user-supplied input in query string parameters and POST data to identify where certain HTML attribute values might be controlled. This provides hot-spot detection for XSS (cross-site scripting) that will require further review by a security analyst to determine exploitability.

Informational	Username Hash Found

Description	A hash of a username (admin) was found in the response. This may indicate that the application is subject to an Insecure Direct Object Reference (IDOR) vulnerability. Manual testing will be required to see if this discovery can be abused.
URL	http://localhost:8080/WebGoat/crypto/hashing/md5
Method	GET
Attack	
Evidence	21232F297A57A5A743894A0E4A801FC3
Instances	1
Solution	Use per user or session indirect object references (create a temporary mapping at time of use). Or, ensure that each use of a direct object reference is tied to an authorization check to ensure the user is authorized for the requested object.
